Research Director’s Report

New timeline for detector activities

For the newly formed detector Executive Board, the first task in the past month was to work out a new timeline under the present financial difficulties. The plan is to maintain the momentum of the detector community. We need to keep the process which began with the Letter of Intent (LOI) procedure toward the integration of various R&D efforts and ideas into an optimised detector design for the ILC. The financial condition imposes limitations on our speed, but we do not pause. The Global Design Effort also is determined and has worked hard to set up a realistic new plan. A key condition for us is to proceed in synchronisation with this GDE timeline. In particular, in order to communicate efficiently with the accelerator team about machine-detector interface (MDI) matters, a well coordinated pace is required. The new detector plans prepared in consultation with the Organizing Committee of the Worldwide Study of Physics and Detectors for Future Linear e+e- Colliders (WWS-OC) were discussed at the last ILCSC meeting on 11 February at DESY and were approved.

Feature Story

Accelerating past the finishing line

It was supposed be the wrap-up meeting of a successful accelerator physics project. However, when the news came that the EU-funded EUROTeV was going to be extended, the meeting in Frascati, Italy, from 23 to 25 January turned into both a summary and a future-planning session. “We’ve got another year to go and the project is as useful now as it was at the kick-off meeting in 2004,” says scientific coordinator Nick Walker from DESY. The collaboration contributed big chunks of R&D to the Reference Design Report and thinks that most of the work can prove useful for projects beyond the ILC. “With the collected EUROTeV expertise in beam dynamics, optics design, positron source R&D and much more we’re almost regarded as an institution,” adds project coordinator Eckhard Elsen.

Director’s Corner

PS – What goes around, comes around

In 2001, Jon Bagger and I served as co-chairs of a long-range planning subpanel for HEPAP, the US’ High Energy Physics Advisory Panel, which recommended a 1-TeV scale linear collider as the highest priority long-term goal for US high-energy physics. Another very important recommendation of that same panel report was to form a new panel that we called the Particle Physics Project Prioritization Panel, or P5. This P5 panel has recently been reconstituted and is undertaking a new long-range study that will probably prove quite important for the future course of the US ILC R&D efforts. The initial P5 meeting took place at the beginning of February at Fermilab, and one session was entirely devoted to efforts globally and in the US towards a linear collider.
